

ABSTRACT

A U-shaped device with two arms and a base. The member is formed of a U-shaped channel of plastic, overlaid exteriorly with a layer of padding, which may be of neoprene. Preferably, the opening at the front of the channel is slightly less than the opening at the base of the channel between the two arms. The device is adapted to fit over the edge of a table such as a commercial folding table to provide forearm comfort and cleanliness for bingo players by helping the forearm to avoid chemical residue, splinters, dirt, cigarette sears and the like.
